

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	The organization was hit by a devious DoS attack, which lasted for 2 hours; the network services also stopped working after an incoming flood of ICMP packets. During this time no network no normal internal network traffic could access any network resources. The incident team responded by blocking ICMP packets from affecting all non-critical network services, and restoring critical network services
Identify	The security team should perform regular audits of the network, firewall configurations, systems, and devices to find security weaknesses. In this incident, the main vulnerability was an unconfigured firewall that allowed a flood of ICMP packets into the network.
Protect	The team should configure firewall rules to limit the rate of incoming ICMP packets and use source IP address verification to detect spoofed IP addresses. Keeping firewall configurations updated will help protect the network from similar DoS attacks.
Respond	During an attack, the team should block malicious ICMP traffic, take non-critical services offline, and prioritize restoring critical network services. After containing the attack, the team should investigate the incident and improve firewall rules and security controls.

Recover	The team should restore critical network services first and then safely bring non-critical services back online. After restoring normal operations, the team should continue monitoring the network and review the incident to prevent similar attacks in the future.
---------	---

Reflections/Notes: This incident shows the importance of properly configuring firewalls and continuously monitoring network traffic. Regular security audits, rate limiting, IP verification, and IDS/IPS monitoring can help detect and prevent future DoS attacks.
